

FOSS COMPLIANCE

Make license compliance part of the build.

Connect SBOM inventory, license intelligence, policy enforcement and evidence so teams catch risk early and keep disclosures current.

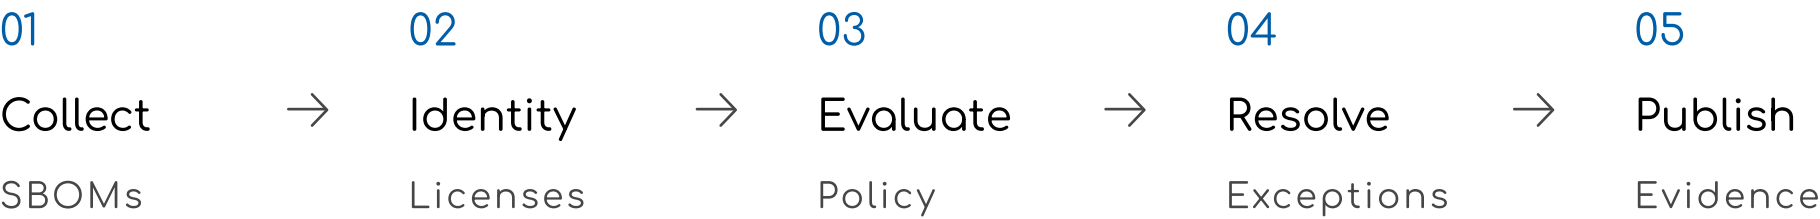

Move compliance decisions upstream, while changes are still cheap to make.

THE PROBLEM

License obligations arrive through dependencies nobody reviewed.

Without a continuous inventory, copyleft conflicts, attribution gaps and policy exceptions surface when a release is already expensive to change.

OPERATING LOOP

CORE WORKFLOWS

- License intelligence

 - Detect copyleft and license conflicts
 - Map obligations to actual components
 - Track license changes across versions
- Policy enforcement

 - Apply project-specific license policies
 - Catch exceptions before release
 - Create repeatable approval workflows
- Attribution evidence

 - Generate accurate NOTICE data
 - Keep customer-ready disclosures current
 - Build evidence from one source of truth
- Operational visibility

 - See which products use each component
 - Trace changes between releases
 - Connect legal risk to engineering context

OPERATIONAL COMPLIANCE

Turn FOSS compliance into a continuous capability

The strongest programs do not add another manual review step. They connect legal evidence to the same software supply chain data engineering and security teams already use.

Legal and compliance	Engineering and security
Earlier detection of copyleft risk	Fewer late-stage legal escalations
Accurate attribution and NOTICE evidence	Visibility into transitive dependencies
Consistent policy enforcement	Policy feedback closer to the build
Audit-ready history across releases	Less manual reconciliation between teams

WORKING MODEL

01	02	03
Complete inventory	Policy at build time	Continuous evidence
Know every component and license obligation that is in scope.	Surface conflicts before release pressure takes over.	Generate attribution and disclosure data from the same source.

WHY EXODOS

One data layer	Inventory, license intelligence, policy, risk and controlled sharing read from the same source of record.
Evidence stays connected	Legal evidence lives with operational data instead of being duplicated across spreadsheets and portals.
Built into the lifecycle	Compliance runs where the software is built, not as a review step bolted on at the end.

THE PRINCIPLE

FOSS compliance works best as part of the lifecycle.
